TECH TOOLS FOR ACTIVISM

About this Booklet

Tech Tools for Activism is a collaboration between different projects of the HacktionLab Network

Tech Tools for Activism is a collaborative project that brings together many different groups that provide technology resources and help aimed at campaigners and activists. There is a website at
techtoolsforactivism.org

HacktionLab is self-funded and the services run and the printing of this book are paid for by contributions from members. If you have a copy of this book in your hands and you find it useful, we would welcome a donation from you. We suggest one pound per booklet.
ttfa.net/donate

HacktionLab is a regular convergence space and online network where activists interested and/or working in the areas of alternative media, renewable energy, on-line video distribution, free software or any other form of activism that utilises technology, can get together and plan how to better harness the technology (or not) to support grass roots social movements. Visit our web site to find out more about HacktionLab-run events and gatherings, including our summer rural gathering, BarnCamp, which takes place in June in the Wye Valley.
Hacktionlab.org

The TTFA Booklet was created with the help of the collborative writing software Book Type and with some support from the FLOSS Manuals community. FLOSS Manuals is a decentraised community of writers who create books and online manuals under open licences. We are always looking for more writers to pitch in. Find out more at **flossmanuals.net**

Further Info

This short booklet was always going to have to strike a difficult balance between the vast amount of information out there on the topic of online security, and the need to make it accessible enough to be understood by humans. Here is a list of further reading for those who wish to delve a little deeper.

wiki.aktivix.org: Aktivix is a UK based radical tech collective and their wiki contains articles on many aspects of internet security along with practical advice on a range of subjects and a space for groups documentation.

flossmanuals.net: FLOSS Manuals is a collection of manuals about free and open source software together with the tools used to create them and the community that uses those tools. There are manuals that explain how to install and use a range of free and open source softwares, about how to do things (like design) with open source software, and manuals about free culture services that use or support free software and formats.

tacticaltech.org: Tactical Tech is an international NGO helping human rights campaigners use information, communications and digital technologies to maximise the impact of their advocacy work.

howtoforge.com: HowtoForge provides user-friendly Linux tutorials about almost every topic.
